

The only Climate denial is refusing to look at Climate Reality...

The reality is that the climate science is unsettled, and the IPCC data and future predictions of a climate emergency has been discredited, and there is open debate about if its any kind of emergency, with all climate impact metrics not showing any adverse trends,

We must challenge any general statements that climate change has an impact on human flourishing as the reverse is true... More CO2 and the slight warming has improved the position of human flourishing and no impact metrics support and climate crisis.

At most some localized adaption may be needed, but the need for global mitigation of CO2 is now considered both unnecessary and impractical.

Many governments are reviewing if they should decommit from the NetZero journey. NetZero has forced an unrealistic constraint on energy policies that has crippled the ability to support an industrialized society and prosperity by preventing energy sources from being affordable, reliable, abundant, and locally available.

The USA is leading the recovery from the debacle of NetZero with Germany now waking up to its mistakes, but the rest of the EU, UK and Australia is still struggling to find the political common sense to move on.

The best report that provides the baseline of reality is the DoE report. And updates will be provided in concert with future releases of IPCC reports so that we get far more reality in the future scientific reporting.
